

TMS27C64 65,536-BIT UV ERASABLE PROGRAMMABLE READ-ONLY MEMORY

TMS27PC64 65,536-BIT PROGRAMMABLE READ-ONLY MEMORY

NOVEMBER 1985—REVISED APRIL 1988

This Data Sheet is Applicable to All TMS27C64s and TMS27PC64s Symbolized with Code "A" as Described on Page 12.

- Organization . . . 8K × 8
- Single 5-V Power Supply
- Pin Compatible with Existing 64K MOS ROMs, PROMs, and EPROMs
- All Inputs/Outputs Fully TTL Compatible
- Max Access/Min Cycle Times

$V_{CC} \pm 5\%$	$V_{CC} \pm 10\%$	
'27C64-100		100 ns
'27C/PC64-120	'27C/PC64-12	120 ns
'27C/PC64-1	'27C/PC64-15	150 ns
'27C/PC64-2	'27C/PC64-20	200 ns
'27C/PC64	'27C/PC64-25	250 ns

- Power Saving CMOS Technology
- Very High-Speed SNAP! Pulse Programming or Fast Programming Algorithms
- 3-State Output Buffers
- 400 mV Guaranteed DC Noise Immunity with Standard TTL Loads
- Latchup Immunity of 250 mA on All Input and Output Lines
- Low Power Dissipation ($V_{CC} = 5.25$ V)
 - Active . . . 158 mW Worst Case
 - Standby . . . 1.4 mW Worst Case (CMOS Input Levels)
- PEP4 Version Available with 168 Hour Burn-In, and also Extended Guaranteed Operating Temperature Ranges

description

The TMS27C64 series are 65,536-bit, ultraviolet-light erasable, electrically programmable read-only memories.

The TMS27PC64 series are 65,536-bit, one-time, electrically programmable read-only memories.

These devices are fabricated using power saving CMOS technology for high-speed and simple interface with MOS and bipolar circuits. All inputs (including program data inputs) can be driven by Series 74 TTL circuits without the use of external pull-up resistors. Each output can drive one Series 74 TTL circuit without external resistors.

The data outputs are three-state for connecting multiple devices to a common bus. The TMS27C64 and the TMS27PC64 are pin compatible with 28-pin 64K MOS ROMs, PROMs, and EPROMs.

EPROMs/PROMs/EEPROMs

6

PRODUCTION DATA documents contain information current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

TMS27PC64 65,536-BIT PROGRAMMABLE READ-ONLY MEMORY

EPROMs/PROMs/EEPROMs

6

The TMS27C64 EPROM is offered in a dual-in-line ceramic package (J suffix) designed for insertion in mounting hole rows on 15,2-mm (600-mil) centers. The TMS27C64 is available with two guaranteed temperature ranges of 0°C to 70°C and -40°C to 85°C (TMS27C64- JL and TMS27C64- JE, respectively). The TMS27C64 is also offered with 168-hour burn-in on both temperature ranges (TMS27C64- JL4 and TMS27C64- JE4, respectively). (See table below).

The TMS27PC64 PROM is offered in a dual-in-line plastic package (N suffix) designed for insertion in mounting hole rows on 15,2-mm (600-mil) centers. The TMS27PC64 is guaranteed for operation from 0°C to 70°C.

All package styles conform to JEDEC standards.

EPROM	SUFFIX FOR OPERATING TEMPERATURE RANGES WITHOUT PEP4 BURN-IN		SUFFIX FOR PEP4 168 HR. BURN-IN VS TEMPERATURE RANGES	
	0°C to 70°C	-40°C to 85°C	0°C to 70°C	-40°C to 85°C
TMS27C64-XXX	JL	JE	JL4	JE4

These EPROMs and PROMs operate from a single 5-V supply (in the read mode), thus are ideal for use in microprocessor-based systems. One other 12-13 V supply is needed for programming. All programming signals are TTL level. These devices are programmable by either Fast or SNAP! Pulse programming algorithms. Fast programming uses a Vpp of 12.5 V and a VCC of 6.0 V for a nominal programming time of two minutes. SNAP! Pulse programming uses a Vpp of 13.0 V and a VCC of 6.5 V for a nominal programming time of one second. For programming outside the system, existing EPROM programmers can be used. Locations may be programmed singly, in blocks, or at random.

operation

There are seven modes of operation listed in the following table. Read mode requires a single 5-V supply. All inputs are TTL level except for Vpp during programming (12.5 V for Fast, or 13.0 V for SNAP! Pulse) and 12 V on A9 for signature mode.

[†]X Can be V_{IL} or V_{IH}.

[‡]V_H = 12 V ± 0.5 V.

read/output disable

When the outputs of two or more TMS27C64s or TMS27PC64s are connected in parallel on the same bus, the output of any particular device in the circuit can be read with no interference from the competing outputs of the other devices. To read the output of a single device, a low-level signal is applied to the $\bar{E}$ and $\bar{G}$ pins. All other devices in the circuit should have their outputs disabled by applying a high-level signal to one of these pins. Output data is accessed at pins Q1 through Q8.

latchup immunity

Latchup immunity on the TMS27C64 and TMS27PC64 is a minimum of 250 mA on all inputs and outputs. This feature provides latchup immunity beyond any potential transients at the P.C. board level when the devices are interfaced to industry-standard TTL or MOS logic devices. Input/output layout approach controls latchup without compromising performance or packing density.

For more information see application report SMLA001; "Design Considerations; Latchup Immunity of the HVCMOS EPROM Family," available through TI Field Sales Offices.

power down

Active I_{CC} current can be reduced from 30 mA to 500 μ A (TTL-level inputs) or 250 μ A (CMOS-level inputs) by applying a high TTL signal to the $\bar{E}$ pin. In this mode all outputs are in the high-impedance state.

erasure (TMS27C64)

Before programming, the TMS27C64 EPROM is erased by exposing the chip through the transparent lid to high intensity ultraviolet light (wavelength 2537 angstroms). EPROM erasure before programming is necessary to assure that all bits are in the logic 1 (high) state. Logic 0s are programmed into the desired locations. A programmed logic 0 can be erased only by ultraviolet light. The recommended minimum ultraviolet light exposure dose (UV intensity × exposure time) is 15 watt-seconds per square centimeter.

EPROMs/PROMs/EEPROMs

6

A typical 12-milliwatt-per-square-centimeter, filterless UV lamp will erase the device in 21 minutes. The lamp should be located about 2.5 centimeters above the chip during erasure. It should be noted that normal ambient light contains the correct wavelength for erasure. Therefore, when using the TMS27C64, the window should be covered with an opaque label.

initializing (TMS27PC64)

The one-time programmable TMS27PC64 PROM is provided with all bits in the logic 1 state, then logic 0s are programmed into the desired locations. Logic 0s programmed into a PROM cannot be erased.

SNAPI Pulse programming

The 64K EPROM and PROM can be programmed using the TI SNAPI Pulse programming algorithm illustrated by the flowchart of Figure 1, which can reduce programming time to a nominal of one second. Actual programming time will vary as a function of the programmer used.

Data is presented in parallel (eight bits) on pins Q1 through Q8. Once addresses and data are stable, $\overline{\text{PGM}}$ is pulsed.

The SNAPI Pulse programming algorithm uses initial pulses of 100 microseconds (μs) followed by a byte verification to determine when the addressed byte has been successfully programmed. Up to 10 (ten) 100 μs pulses per byte are provided before a failure is recognized.

The programming mode is achieved when $V_{\text{pp}} = 13.0 \text{ V}$, $V_{\text{CC}} = 6.5 \text{ V}$, $\overline{\text{G}} = V_{\text{IH}}$, and $\overline{\text{E}} = V_{\text{IL}}$. More than one device can be programmed when the devices are connected in parallel. Locations can be programmed in any order. When the SNAPI Pulse programming routine is complete, all bits are verified with $V_{\text{CC}} = V_{\text{pp}} = 5 \text{ V}$.

Fast programming

The 64K EPROM and PROM can be programmed using the Fast programming algorithm illustrated by the flowchart in Figure 2. During Fast programming, data is presented in parallel (eight bits) on pins Q1 through Q8. Once addresses and data are stable, $\overline{\text{PGM}}$ is pulsed. The programming mode is achieved when $V_{\text{pp}} = 12.5 \text{ V}$, $V_{\text{CC}} = 6.0 \text{ V}$, $\overline{\text{G}} = V_{\text{IH}}$, and $\overline{\text{E}} = V_{\text{IL}}$. More than one device can be programmed when the devices are connected in parallel. Locations can be programmed in any order.

Fast programming uses two types of programming pulses: Prime and Final. The length of the Prime pulse is 1 millisecond; this pulse is applied X times. After each Prime pulse, the byte being programmed is verified. If the correct data is read, the Final programming pulse is applied; if correct data is not read, an additional 1 millisecond pulse is applied up to a maximum X of 25. The Final programming pulse is 3X long. This sequence of programming and verification is performed at $V_{\text{CC}} = 6.0 \text{ V}$ and $V_{\text{pp}} = 12.5 \text{ V}$. When the full Fast programming routine is complete, all bits are verified with $V_{\text{CC}} = V_{\text{pp}} = 5 \text{ V}$.

program inhibit

Programming may be inhibited by maintaining a high level input on the $\overline{\text{E}}$ or $\overline{\text{PGM}}$ pin.

program verify

Programmed bits may be verified with $V_{\text{pp}} = 12.5 \text{ V}$ when $\overline{\text{G}} = V_{\text{IL}}$, $\overline{\text{E}} = V_{\text{IL}}$, and $\overline{\text{PGM}} = V_{\text{IH}}$.

signature mode

The signature mode provides access to a binary code identifying the manufacturer and type. This mode is activated when A9 is forced to $12 \text{ V} \pm 0.5 \text{ V}$. Two identifier bytes are accessed by A0; i.e., A0 = V_{IL} accesses the manufacturer code, which is output on Q1-Q8; A0 = V_{IH} accesses the device code, which is output on Q1-Q8. All other addresses must be held at V_{IL} . Each byte possesses odd parity on bit Q8. The manufacturer code for these devices is 97, and the device code is 07.

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)‡

Supply voltage range, VCC (see Note 1)	–0.6 V to 7 V
Supply voltage range, Vpp (see Note 1)	–0.6 V to 14 V
Input voltage range (see Note 1): All inputs except A9	–0.6 V to 6.5 V
A9	–0.6 V to 13.5 V
Output voltage range (see Note 1)	–0.6 V to VCC + 1 V
Operating free-air temperature range ('27C64–_JL and JL4; '27PC64–_NL)	0°C to 70°C
Operating free-air temperature range ('27C64–_JE and JE4)	–40°C to 85°C
Storage temperature range	–65°C to 150°C

‡Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions beyond those indicated in the "Recommended Operating Conditions" section of this specification is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: Under absolute maximum ratings, voltage values are with respect to GND.
